

Argentina

Lung Cancer Factsheet: Insights & Key Developments

Key Insights on Lung Cancer Care and Infrastructure

Core Pillars:

- 1. Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Lung Cancer Screening

Lung cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping lung cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

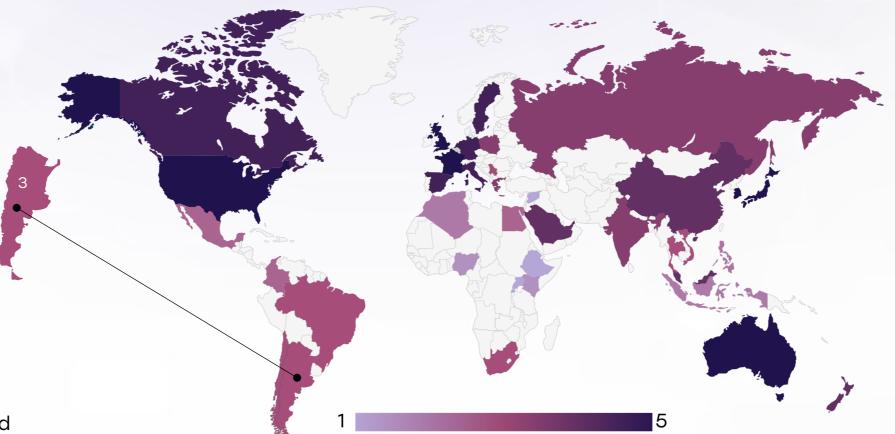

- Incidence: Approximately 13,016 new lung cancer cases in 2022, making it the third most common cancer after breast and colorectal cancers.
- Mortality: Leading cause of cancer-related deaths, with over 10,673 deaths recorded in 2022.
- Age-Standardized Rates (ASR): Age-adjusted incidence rate of lung cancer was 215.48 cases per 100,000 inhabitants in 2022.
- Gender Disparities: Lung cancer mortality has decreased in men over the past two decades, with a similar declining trend observed in women since 2015.
- Survival Rate: Overall 5-year median survival rate is approximately 10.9%, lower than the 25.4% observed in the United States.
- Economic Burden: Estimated at \$556.2 million USD in 2023, accounting for about 1.4% of the nation's total healthcare expenditure.
- Smoking Prevalence: Tobacco consumption is a major risk factor, contributing to approximately 80% of lung cancer cases. In 2020, smoking was responsible for 44,758 deaths in Argentina, with one-third attributed to lung cancer and other tumors.
- Regional Variations: The city of Rosario has reported a notably high lung cancer mortality rate of 62.7 per 100,000 individuals.
- Molecular Testing: Molecular testing rate for non-small cell lung cancer (NSCLC) patients is 79%, the highest in Latin America. However, access remains limited in the public healthcare sector, with only 41% of patients having access.

Argentina Infrastructure

W

0

Strengths

- Moderately developed lung cancer infrastructure, with ~50 specialized oncology centers.
- 80% of tertiary hospitals offer radiotherapy and chemotherapy.
- Telemedicine and digital pathology are expanding, improving rural access.
- Comprehensive biomarker testing (EGFR, ALK, PD-L1, ROS1, MET, BRAF, KRAS) available in private and research centers.

Opportunity

- Expand national lung cancer screening and early detection programs.
- Increase investments in NGS and molecular testing infrastructure across public hospitals.
- Extend public reimbursement to include biomarker-driven therapies.
- Leverage telemedicine and digital platforms to bridge urban-rural care gaps.

Weakness

- Limited access to advanced diagnostics and treatments in rural regions.
- Only 40-50% of public hospitals provide full molecular testing.
- Less than 30% of oncology centers are equipped with NGS technology.
- Public reimbursement does not typically cover advanced treatments (e.g., immunotherapy, targeted therapies).
- Disparities between public and private care.

- Economic disparities may widen access inequality.
- Reliance on private healthcare for precision medicine may limit equitable outcomes.
- Fragmented healthcare system may hinder coordinated policy implementation.
- Delayed adoption of international guidelines in public hospitals.

- 4. Strong infrastructure in major hospitals and cancer centers, some regional disparities.
- 3. Moderate infrastructure, primarily in private settings or research institutions.

- 2. Limited infrastructure, available only in select centers or for high-cost private testing.
- 1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Argentina

0

Strengths

- Private hospitals and research institutions provide advanced treatments like NGS and immunotherapy.
- Academic institutions and international collaborations are contributing to molecular oncology research.

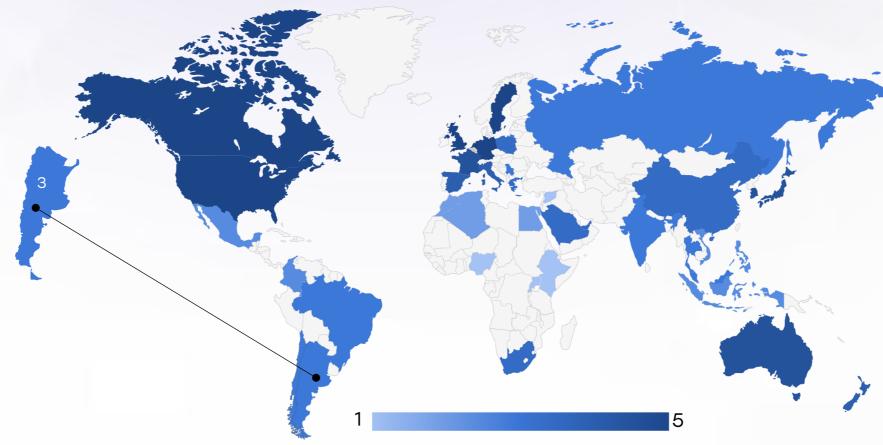

Opportunity

- Expand reimbursement for targeted therapies to reduce access gaps.
- Launch national awareness campaigns and screening programs to support early detection.

Weakness

- Public hospitals offer only standard treatments; access to targeted therapies is limited.
- Research funding is low, with few governmentbacked trials and limited private investment.

- Lack of national screening leads to late-stage diagnoses.
- Low public awareness of lung cancer risks and prevention.

- 5. Strong healthcare infrastructure with comprehensive treatment access, high research funding, and nationwide awareness campaigns. Patients have access to advanced therapies, clinical trials, and widespread early detection programs.
 - 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
 - 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
 - Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
 - 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Survival Rates, Early Detection and Palliative Care

Strengths

- Biomarker testing is available in ~50-60% of tertiary hospitals, supporting personalized treatment.
- Palliative care services exist in major urban cancer centers.

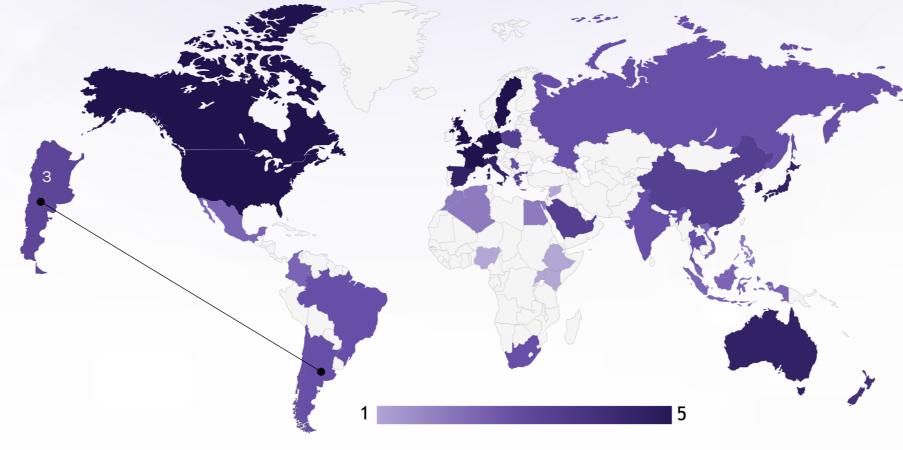

Opportunity

- Expanding LDCT screening and improving early detection can raise 5-year survival rates (currently ~15-20%).
- Public reimbursement for targeted therapies and wider biomarker access could reduce disparities.

Weakness

- Over 70% of lung cancer cases are diagnosed at Stage III/IV, contributing to poor survival rates.
- Only ~40% of patients with advanced cancer receive specialized palliative care, especially limited in rural areas.

- Lack of a national screening program results in low early detection (under 10% participation).
- Funding limitations in public healthcare create inequality in access to personalized treatment.

- 5. High survival rates, strong early detection programs, and well-established palliative care services. Patients have access to timely diagnosis, advanced treatments, and comprehensive end-of-life care.
- 4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.
 - 3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life care.
 - 2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.
 - 1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Argentina Willization of Biomarkers

0

os1, and 1.7 4.164

Strengths

- 77% availability of EGFR testing, guiding targeted treatment.
- 84% availability of PD-L1 testing, guiding immunotherapy.
- High PD-L1 testing availability, important for immunotherapy.
- KRAS testing at 67%, relevant for new therapies.

Opportunity

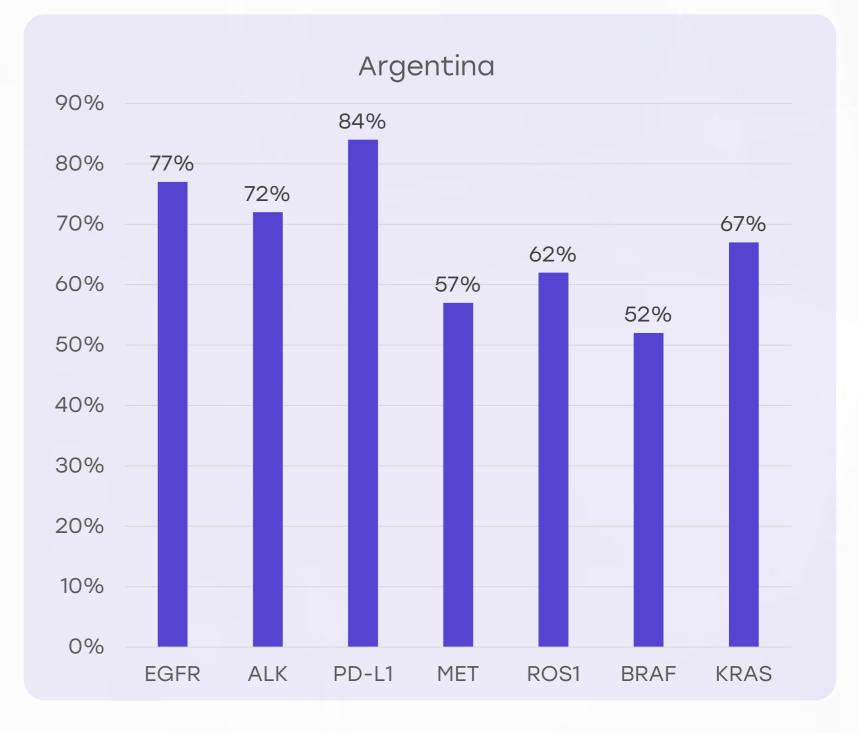

- Expanding coverage for comprehensive molecular testing.
- Integration of molecular testing into national guidelines.
- Potential to improve treatment personalization and survival.
- Growing relevance of new therapies and precision medicine.

Weakness

- Limited testing for MET, ROS1, and BRAF (52%-62%).
- Significant variability in access between public and private sectors.
- Delays and out-of-pocket costs for patients in public hospitals.
- Biomarker testing is not yet fully integrated into national guidelines.

- Potential inequity in access leading to disparities in treatment.
- Financial barriers for public healthcare patients.
- Slow adoption of advanced testing in certain regions.
- Limited infrastructure in non-comprehensive cancer centers.

- 5. Biomarker testing is widely available and routinely performed as part of standard clinical practice. Strong integration into treatment decisions, with national coverage and reimbursement ensuring accessibility.
 - 4. Biomarker testing is commonly used, but access may be limited in certain regions or patient groups. Some disparities exist in coverage or affordability, but it is still a crucial part of cancer diagnostics
 - 3. Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.
 - Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.
 - 1. Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

Argentina Clinical Guidelines

S

0

W

Strengths

- Moderate implementation of clinical guidelines for lung cancer.
- National protocols align partially with international standards.
- Structured implementation of clinical guidelines.

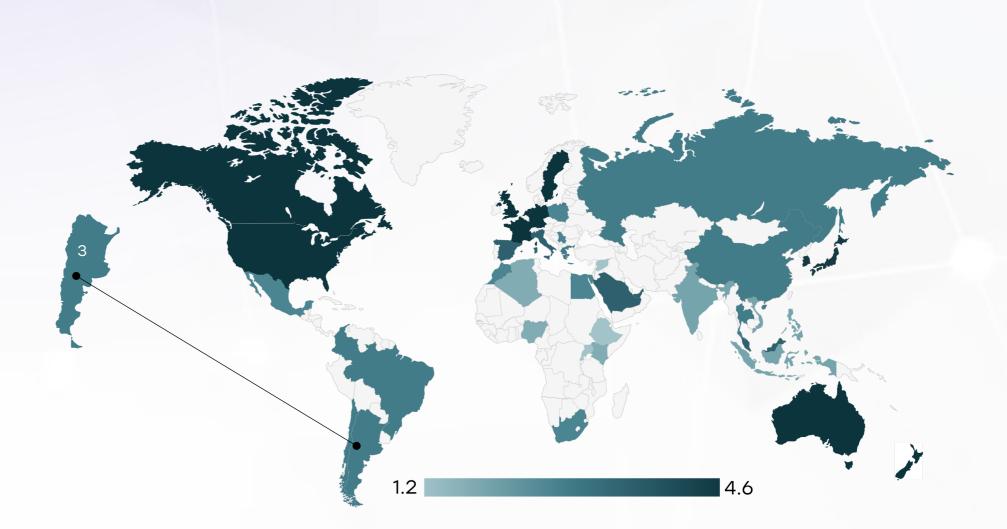

Weakness

- Feasibility of integrating new advancements is limited due to resource constraints.
- Variability in guideline adoption between private and public healthcare institutions.
- Limited engagement with updates and revisions, particularly in public hospitals.
- Delayed access to the latest treatments and technologies in public hospitals.

Opportunity

- Strengthening national integration efforts for clinical guidelines.
- Improving dissemination of updated clinical recommendations.
- Enhancing standardized care across the country.
- Potential to improve patient outcomes through better guideline adoption.

- Resource constraints hindering the integration of new advancements.
- Regional disparities affecting access to up-todate treatments and technologies.
- Slow adoption of updated guidelines in public healthcare institutions.

	Very High	High	Medium	Low	Very Low

Argentina Reimbursement

S

0

W

Strengths

- Partial reimbursement framework for lung cancer care in place.
- Some treatments and diagnostic procedures are reimbursed.
- No-cost access to essential treatments in public hospitals.
- Coverage for EGFR, ALK, and PD-L1 testing is relatively high (77%, 72%, and 84%).

Opportunity

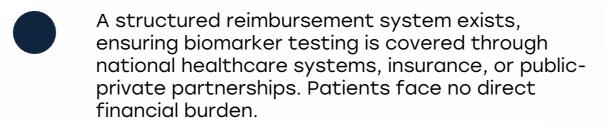

- Expanding universal coverage for lung cancer care.
- Streamlining reimbursement policies for more consistent access.
- Potential to improve equitable access to treatments across the country.
- Enhancing support for rural patients through better financial coverage.

Weakness

- Gaps in reimbursement for advanced molecular testing and targeted therapies.
- Inconsistent coverage for MET (57%), ROS1 (62%), BRAF (52%), and KRAS (67%).
- Access to treatments varies by provincial policies and healthcare funding.
- Higher out-of-pocket expenses for patients in rural areas.

Threats

- Inconsistent reimbursement coverage for advanced treatments and molecular testing.
- Variability in access to care between urban and rural areas.
- Financial limitations in public healthcare affecting equitable access.

A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.

No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

Argentina Lung Cancer Screening

Strengths

- LDCT machines are available in tertiary hospitals in urban centers such as Algiers and Oran.
- High-risk patients with symptoms or history are sometimes referred for imaging.

s w

Opportunity

- Scope to establish a national screening policy targeting highrisk populations.
- Improving awareness and training for primary healthcare workers could boost early detection.
- Potential to partner with international health bodies to initiate pilot screening programs.

Weakness

- No national LDCT lung cancer screening program in place.
- Fewer than 10% of high-risk individuals (e.g., heavy smokers aged 55-74) undergo regular imaging.
- Absence of standardized referral or follow-up pathways.
- Limited awareness of early detection protocols among primary care providers.

- More than 65% of lung cancer cases are diagnosed at late stages due to lack of organized screening.
- Continued neglect of early screening could exacerbate morbidity and mortality.

Country	Lung Cancer Screening
United States	Annual LDCT (50-80 years, high-risk smokers)
United Kingdom	LDCT for high-risk individuals (55-74 years)
Canada	LDCT for high-risk individuals (55-74 years)
Australia	No national program, high-risk groups advised LDCT
Germany	No national program, under evaluation
France	No national LDCT screening
Netherlands	Participating in European screening studies
Sweden	No national LDCT screening
Italy	Regional pilot LDCT screening
Spain	No national LDCT program
Poland	No national program
Japan	No national LDCT program
South Korea	LDCT for high-risk individuals (50-74 years)
China	No national LDCT program
India	No national LDCT program
Singapore	No national LDCT program
Saudi Arabia	No national LDCT program; some hospital-based opportunistic screening
UAE	No national LDCT program; early-stage pilot studies ongoing in select hospitals
Syria	No national LDCT program; screening not prioritized due to conflict
Malaysia	No program; high-risk CT pilots

Country	Lung Cancer Screening
Thailand	No national LDCT program
South Africa	No national LDCT program
Kenya	No national LDCT program
Nigeria	No national LDCT program
Egypt	No national LDCT program
Morocco	No national LDCT program
Algeria	No national LDCT program
Ethiopia	No national LDCT program
Mexico	No national LDCT program
Brazil	No national LDCT program
Argentina	No national LDCT program
Chile	No national LDCT program
Colombia	No national LDCT program
New Zealand	No national LDCT program
Greece	No national LDCT program
Rwanda	No national LDCT program
Uganda	No national LDCT program
Serbia	No national LDCT program
Indonesia	No national LDCT program; opportunistic screening in private sector
Vietnam	No national LDCT program; early pilot screening studies in Hanoi and Ho Chi Minh
Philippines	No national LDCT program; feasibility and awareness programs under discussion
Russia	No formal national LDCT program; regional pilot screening programs in large cities
