

Lung Cancer Factsheet: Insights & Key Developments

Key Insights on Lung Cancer Care and Infrastructure

Core Pillars:

- 1. Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Lung Cancer Screening

Lung cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping lung cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

- Annual new cases: ~43,000
- Incidence rate: ~73 per 100,000
- Annual deaths: ~34,000
- 5-year survival rate: ~16%
- 10-year survival rate: ~10%
- Most affected age group: 65-74 years
- Gender distribution: Men (~65%), Women (~35%)
- Smoking prevalence (adults): ~24%
- Stage at diagnosis: ~70% diagnosed at advanced stages (III/IV)
- Most common type: Non-small cell lung cancer (NSCLC)
- Daily new diagnoses: ~118
- Daily deaths: ~93
- Molecular testing: Widely available in major hospitals
- Targeted therapy & immunotherapy: Available and increasingly used

Italy Infrastructure

Strengths

 Italy boasts a robust network of oncology centers, particularly in urban areas, providing advanced diagnostic and treatment services for lung cancer patients.

s w

0

Weakness

 There is a disparity in access to specialized care between urban and rural regions, leading to potential delays in diagnosis and treatment for patients in less populated areas.

Opportunity

 Investing in telemedicine and mobile health units can bridge the urban-rural gap in cancer care services.

Threats

 Economic constraints and regional disparities may impede uniform infrastructure development and maintenance across the country.

3. Moderate infrastructure, primarily in private settings or research institutions.

2. Limited infrastructure, available only in select centers or for high-cost private testing.

4. Strong infrastructure in major hospitals and

cancer centers, some regional disparities.

1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Italy

Treatment Access, Research Funding and Awareness Campaigns

• Italy adheres to international treatment guidelines, and therapies such as immunotherapy are available for eligible patients.

Opportunity

 Limited national for cancer resear awareness camp hampers progres early detection of treatment innove

Threats

• Collaborations with · Low public aware international research about lung cance initiatives can enhance symptoms and funding opportunities and screening option lead to delayed diagnoses. knowledge exchange.

Italy

Survival Rates, Early Detection and Palliative Care

Strengths

Opportunity

nationwide screening

significantly improve

early detection rates

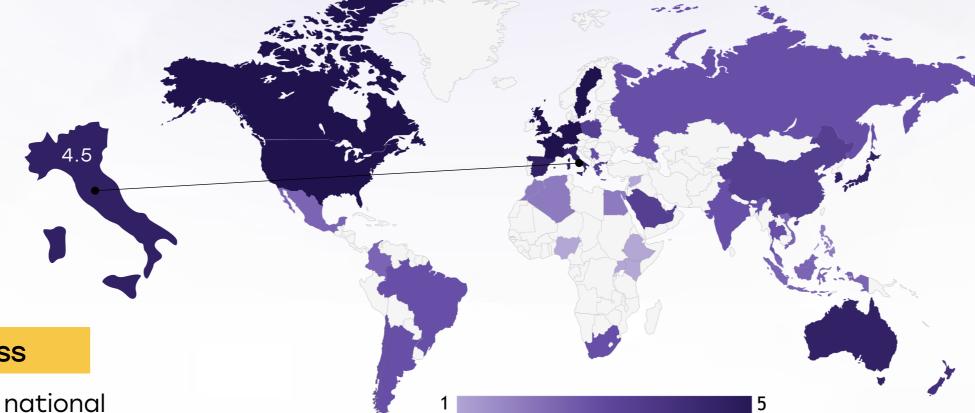

and survival outcomes.

Establishing a

program could

 Pilot studies indicate that implementing lowdose computed tomography (LDCT) screening could reduce lung cancer mortality by approximately 39% over ten years.

s w

Weakness

 Italy lacks a national lung cancer screening program, resulting in most cases being diagnosed at advanced stages.

5. High survival rates, strong early detection programs, and well-established palliative care services. Patients have access to timely diagnosis, advanced treatments, and comprehensive end-of-life care.

4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.

3. Moderate survival rates, early detection

 An aging population and high smoking prevalence may increase lung cancer incidence.

experience delays in diagnosis or limited end-of-life care.

2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer

available but not widespread, and palliative care

services mainly in urban centers. Some patients

1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

patients face significant access barriers.

Italy Utilization of Biomarkers

Strengths

 The use of PD-L1 testing has increased, aiding in personalized treatment decisions.

O T

Weakness

 Testing for other biomarkers like EGFR and ALK remains inconsistent, indicating room for improvement.

Opportunity

 Expanding comprehensive biomarker testing can optimize treatment strategies and improve patient outcomes.

Threats

 Limited access to advanced molecular diagnostics in certain regions may hinder the adoption of targeted therapies.

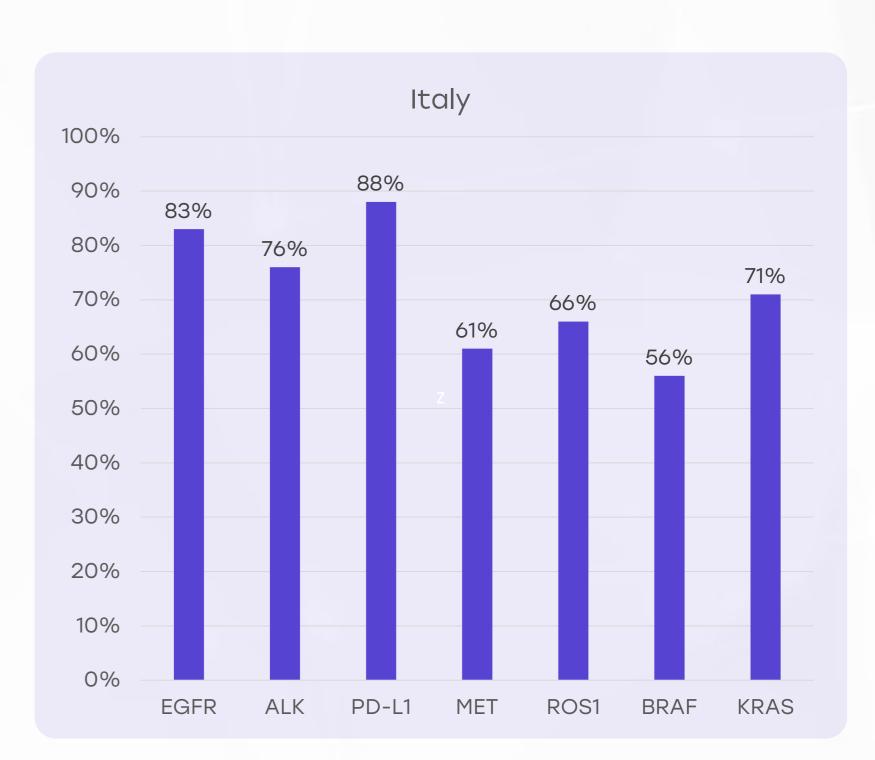

4. Biomarker testing is commonly used, but access may be limited in certain regions or patient groups. Some disparities exist in coverage or affordability, but it is still a crucial part of cancer diagnostics

3. Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.

2. Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.

1. Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

Strengths

 Italy follows international clinical guidelines for lung cancer management, ensuring standardized care practices.

0

Weakness

 There is a lack of national guidelines tailored to the Italian healthcare context, potentially leading to inconsistencies in care delivery.

Opportunity

 Developing and implementing national guidelines can address local healthcare system nuances and improve care uniformity.

Threats

 Rapid advancements in lung cancer treatment require continuous updates to guidelines, which may strain resources.

	Very High	High	Medium	Low	Very Low
Clinical Guideline Implementation	*	0	*	*	*
Feasibility of Integration	*	0	*	*	*
Adoption of International Guidelines	*	0	*	*	*
Engagement with Updates	*	*	0	*	*
ESMO Guidelines Implementation	*	0	*	*	*

Strengths

 The national health insurance system covers standard lung cancer treatments, reducing financial barriers for patients.

Weakness

 Delays in the reimbursement of new therapies and diagnostics can limit timely access to innovative treatments.

Opportunity

 Streamlining reimbursement processes can facilitate quicker integration of emerging therapies into clinical practice.

Threats

 Economic challenges may impact the sustainability of funding for high-cost treatments and diagnostics.

- A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or public-private partnerships. Patients face no direct financial burden.
- A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

Strengths

 Pilot programs and modeling studies demonstrate the cost-effectiveness and potential mortality reduction benefits of LDCT screening in high-risk populations.

S

0

W

Т

Weakness

 There is currently no formal national lung cancer screening program in Italy.

Opportunity

 Implementing a nationwide LDCT screening program could lead to earlier diagnoses and improved survival rates.

Threats

 Resource limitations and lack of public awareness may hinder the successful rollout of a national screening initiative.

Country	Lung Cancer Screening
United States	Annual LDCT (50-80 years, high-risk smokers)
United Kingdom	LDCT for high-risk individuals (55-74 years)
Canada	LDCT for high-risk individuals (55-74 years)
Australia	No national program, high-risk groups advised LDCT
Germany	No national program, under evaluation
France	No national LDCT screening
Netherlands	Participating in European screening studies
Sweden	No national LDCT screening
Italy	Regional pilot LDCT screening
Spain	No national LDCT program
Poland	No national program
Japan	No national LDCT program
South Korea	LDCT for high-risk individuals (50-74 years)
China	No national LDCT program
India	No national LDCT program
Singapore	No national LDCT program
Saudi Arabia	No national LDCT program; some hospital-based opportunistic screening
UAE	No national LDCT program; early-stage pilot studies ongoing in select hospitals
Syria	No national LDCT program; screening not prioritized due to conflict
Malaysia	No program; high-risk CT pilots

Country	Lung Cancer Screening
Thailand	No national LDCT program
South Africa	No national LDCT program
Kenya	No national LDCT program
Nigeria	No national LDCT program
Egypt	No national LDCT program
Morocco	No national LDCT program
Algeria	No national LDCT program
Ethiopia	No national LDCT program
Mexico	No national LDCT program
Brazil	No national LDCT program
Argentina	No national LDCT program
Chile	No national LDCT program
Colombia	No national LDCT program
New Zealand	No national LDCT program
Greece	No national LDCT program
Rwanda	No national LDCT program
Uganda	No national LDCT program
Serbia	No national LDCT program
Indonesia	No national LDCT program; opportunistic screening in private sector
Vietnam	No national LDCT program; early pilot screening studies in Hanoi and Ho Chi Minh
Philippines	No national LDCT program; feasibility and awareness programs under discussion
Russia	No formal national LDCT program; regional pilot screening programs in large cities
