

Breast Cancer Factsheet: Insights & Key Developments

Key Insights on Breast Cancer Care and Infrastructure

Core Pillars:

- 1. Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Breast Cancer Screening

Breast cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping breast cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

- Incidence: Approximately 3,500 women and 25 men are diagnosed annually.
- · Lifetime Risk: 1 in 9 women will develop breast cancer during their lifetime.
- Daily Diagnoses: Up to nine women are diagnosed with breast cancer each day.
- Mortality: Nearly two women die from breast cancer daily, totaling over 650 deaths annually.
- Age Distribution: Women over 50 are at the highest risk, but about 11% of cases occur in women aged 25 to 44.
- Ethnic Disparities:
- Māori Women: 21% more likely to be diagnosed, 30% less likely to be diagnosed early, and 72% more likely to die from breast cancer compared to non-Māori.
- Pasifika Women: Highest rate of advanced-stage diagnoses and higher mortality rates.
- Survival Rates:
- Five-year survival rates have improved, cutting the risk of dying from breast cancer in half since 2003.
- Māori Women: 33% more likely to die within 10 years post-diagnosis than Pākehā women.
- Pasifika Women: 52% more likely to die within 10 years post-diagnosis than Pākehā women.
- Screening Participation:
- BreastScreen Aotearoa aims for a 70% screening rate for women aged 45 to 69.
- Screening rates are lower among Māori and Pasifika women, contributing to later-stage diagnoses.
- Male Breast Cancer: Approximately 25 men are diagnosed with breast cancer each year.

Infrastructure

Strengths

- Public hospitals and specialist cancer centers (like Auckland City Hospital, Christchurch Hospital) provide full-spectrum breast cancer services.
- National digital systems support referrals and breast imaging.

Opportunity

- Expand regional mobile diagnostic services and telemedicine follow-ups.
- Invest in workforce retention and rural infrastructure under the new Te Whatu Ora health reform.

Weakness

- Rural and remote communities (e.g., South Island, Northland) face travel barriers to reach diagnostic/treatment services.
- Workforce shortages in radiology and oncology affect waiting times.

- Aging infrastructure in certain public hospitals may reduce quality of care.
- Health inequities may widen if urban-rural gaps persist.

72-	
	1 4.5
	5. Advanced nationwide infrastructure, widespread availability in public and private sectors, integration with clinical practice.
	4. Strong infrastructure in major hospitals and cancer centers, some regional disparities.
	3. Moderate infrastructure, primarily in private settings or research institutions.
	2. Limited infrastructure, available only in select centers or for high-cost private testing.
	1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Treatment Access, Research Funding and Awareness Campaigns

Strengths

- Publicly funded access to surgery, chemotherapy, radiation, endocrine therapy, and targeted agents.
- Active breast cancer research groups and government-supported trials.
- National campaigns like Pink Ribbon Month have strong visibility.

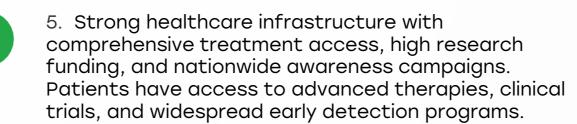

Opportunity

- Expand culturally tailored awareness and navigation services for Māori and Pasifika communities.
- Increase funding for genomics and equity-focused breast cancer research.

Weakness

- Delays in access to newer drugs (e.g., trastuzumabderuxtecan, abemaciclib) due to slow funding decisions by PHARMAC.
- Māori and Pacific women experience lower rates of timely access and followup.

- Growing treatment costs and resource pressures could delay access to innovation.
- Distrust in health systems by marginalized groups may reduce participation.

- 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
- 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
- 2. Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
- 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Survival Rates, Early **Detection** and Palliative Care

Strengths

- High 5-year survival rate (~88%) among women overall.
- Strong early detection due to organized screening and timely diagnostic pathways.
- Palliative and psychosocial care are integrated into oncology services.

Opportunity

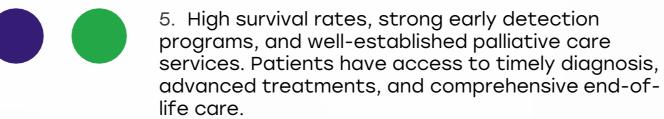

- Tailor survivorship and support services for underserved populations.
- Strengthen coordination of primary care and palliative services.

Weak

- Māori wom lower 5-year (~79%) and are more often diagnosed at later stages.
- Inequities in access to culturally safe palliative and survivorship care.

Threats

- Persisting disparities in health literacy and access may worsen outcome gaps.
- Rising incidence among younger women may challenge early detection strategies.

4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.

3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life care.

2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.

1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Utilization of Biomarkers

Strengths

- Standard testing for ER, PR, HER2 is routinely available in public and private pathology labs.
- Access to multigene assays (e.g., Oncotype DX) for hormone-positive early-stage disease is increasing.

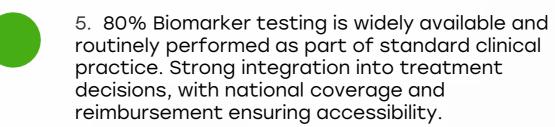

Opportunity

- Fund genomic profiling for eligible patients to avoid over-treatment.
- Expand molecular diagnostics access through centralized labs.

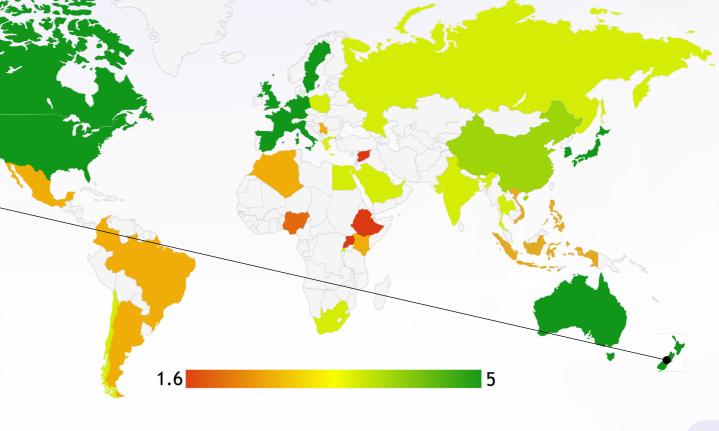

Weakness

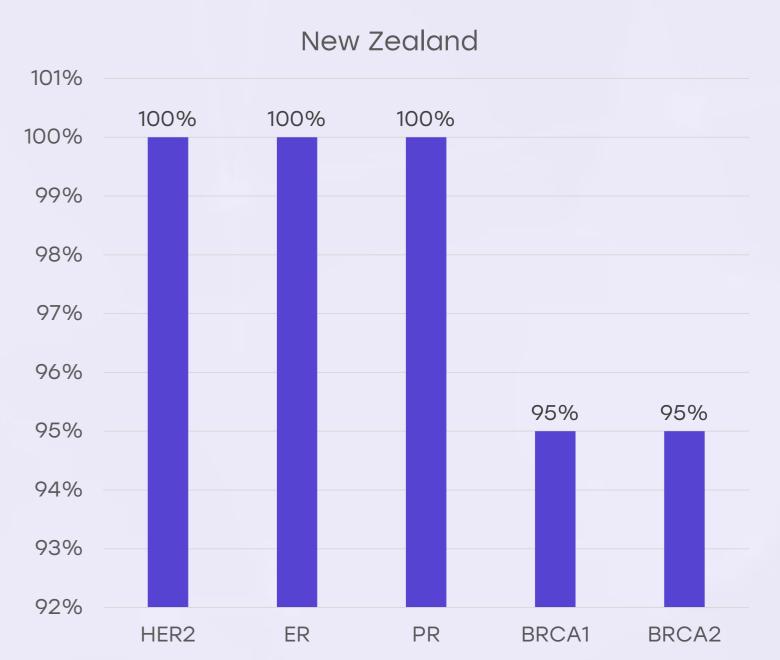

- Genomic tests are not publicly funded and may only be used in private care.
- Liquid biopsies and NGS-based profiling are limited to research or private sector.

- Lack of equitable biomarker access could deepen disparities between public vs private patients.
- Delays in adopting emerging markers may hinder treatment optimization.

- 4. 61-80%. Biomarker testing is commonly used, but access may be limited in certain regions or patient groups. Some disparities exist in coverage or affordability, but it is still a crucial part of cancer diagnostics
- 41-60% Moderate utilization, often restricted to major hospitals or private healthcare settings.
 Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.
- 2. 20-40% Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.
- 1. <20% Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

Clinical Guidelines

Strengths

- Use of comprehensive national guidelines (NZ Ministry of Health & NZBCF) in alignment with international standards.
- Multidisciplinary team care models are standard practice in urban centers.

Opportunity

- · Incorporate equity targets and culturally adapted guidelines for Māori health.
- National digital pathway dashboards can improve tracking and consistency.

Weakness

- Implementation and compliance with guidelines may vary in rural or lower-resourced areas.
- Real-time auditing of outcomes and adherence remains limited.

Threats

 Health system restructuring may create transitional gaps in quality monitoring.

Reimbursement

Strengths

- New Zealand's public health system provides free treatment for most standard therapies under Te Whatu Ora.
- PHARMAC negotiates drug prices to keep care affordable.

Opportunity

- Strengthen early HTA and fast-track reimbursement for highpriority cancer innovations.
- Expand subsidies for diagnostics and reconstruction surgeries.

Weakness

- Reimbursement delays for novel treatments may force patients into out-of-pocket private care.
- Not all diagnostics (e.g., genomic assays) are reimbursed under the public system.

- High drug costs and slow PHARMAC processes could delay adoption of cuttingedge therapies.
- Dual system (publicprivate) may create inequity in who gets advanced care.

- Yes A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or publicprivate partnerships. Patients face no direct financial burden.
- Partial A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

Breast Cancer Screening

Strengths

- BreastScreen **Aotearoa** provides free mammograms for women aged 45-69 every two years.
- High-quality screening standards and mobile mammography units.

Opportunity

- Intensify community outreach and culturally tailored navigation.
- Use AI tools to support radiologist capacity in remote settings.

Weakness

- Participation rate among eligible women is ~70% nationally but lower for Māori (~62%) and Pacific women (~65%).
- Screening age range still excludes younger high-risk populations.

- Misinformation and health system mistrust may suppress uptake in vulnerable communities.
- Staffing shortages could affect continuity of mobile services.

Country	Breast Cancer Screening
United States	Biennial mammograms (50-74 years)
United Kingdom	Triennial mammograms (50-71 years)
Canada	Mammograms every 2-3 years (50-74 years)
Australia	Biennial mammograms (50-74 years)
Germany	Mammograms every 2 years (50-69 years)
France	Biennial mammograms (50-74 years)
Netherlands	Mammograms every 2 years (50-75 years)
Sweden	Mammograms every 18-24 months (40- 74 years)
Italy	Mammograms every 2 years (50-69 years)
Spain	Mammograms every 2 years (50-69 years)
Poland	Mammograms every 2 years (50-69 years)
Japan	Mammograms every 2 years (40+ years)
South Korea	Biennial mammograms (40+ years)
China	Regional mammogram programs (40-69 years)
India	Opportunistic screening
Singapore	Biennial mammograms (50-69 years)
Saudi Arabia	Opportunistic screening; regional programs for women aged 40+
UAE	Opportunistic screening; encouraged every 2 years for 40-69 years
Syria	No national program; limited local initiatives due to conflict

Country	Breast Cancer Screening
Thailand	Biennial mammograms (50-69 years)
South Africa	Opportunistic screening
Kenya	No national program
Nigeria	No national program
Egypt	National awareness campaigns
Morocco	National program for 45-69 years
Algeria	Planned national program (50-69 years)
Ethiopia	No national program
Mexico	Biennial mammograms (40-69 years)
Brazil	Biennial mammograms (50-69 years)
Argentina	Biennial mammograms (50-69 years)
Chile	Mammograms every 3 years (50-69 years)
Colombia	Biennial mammograms (50-69 years)
New Zealand	Biennial mammograms (45-69 years)
Greece	Biennial mammograms (50-69 years)
Rwanda	No national program
Uganda	No national program
Serbia	Biennial mammograms (50-69 years)
Indonesia	Opportunistic screening; no national mammography program
Vietnam	Regional mammography programs; pilot programs in urban areas (age 45-69)
Philippines	Opportunistic screening; mammography recommended every 2 years for women 50+
Russia	National program for biennial mammograms (50-69 years)
