

Colorectal Cancer Factsheet: Insights & Key Developments

Key Insights on Colorectal Cancer Care and Infrastructure

Core Pillars:

- 1. Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Colorectal Cancer Screening

Colorectal cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping colorectal cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

- Incidence share: Colorectal cancer is the second most common cancer in men.
- Incidence rate: Around 40 per 100,000 men per year.
- Total new cases (2022): Approximately 20,500 men.
- Daily diagnoses (2022): Around 56 men per day.
- Deaths (2022): About 9,500 men.
- 5-year survival rate: Estimated 65-70%.
- Most affected age group: Primarily men aged 60-79.
- Screening participation: Organized national screening program (biennial FIT) for men aged 50-74; participation is moderate (~35%).

France

Infrastructure

Strengths

- Advanced oncology infrastructure with specialized cancer centers (e.g., Institut Gustave Roussy, Centre Léon Bérard).
- Universal healthcare system ensures access to diagnostics, surgery, and follow-up.

0 T

Weakness

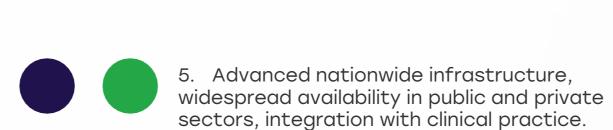

- Regional disparities in access-rural populations may face delays for diagnostics and advanced care.
- Increasing demand places pressure on diagnostic imaging and pathology departments.

Opportunity

- Expansion of digital health and tele-oncology platforms to connect remote areas with expert care.
- Investment in AI and robotics for diagnostics and colorectal surgery can improve precision and capacity

Threats

- Aging infrastructure in certain public hospitals may hinder capacity for increasing cancer caseloads.
- Workforce shortages (e.g., in pathology, oncology nursing) can delay diagnosis and treatment.

4. Strong infrastructure in major hospitals and cancer centers, some regional disparities.

 Moderate infrastructure, primarily in private settings or research institutions.

2. Limited infrastructure, available only in select centers or for high-cost private testing.

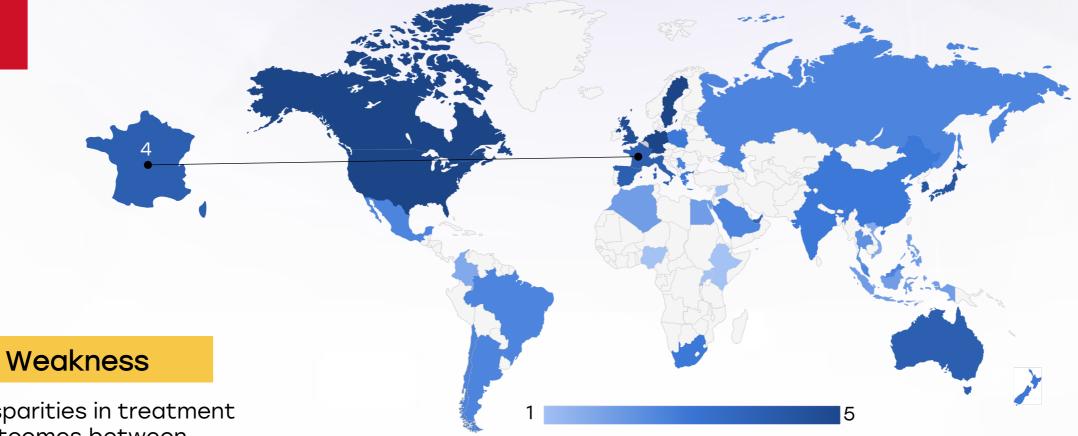

1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Treatment Access, Research Funding and Awareness Campaigns

Strengths

- Strong national cancer plans (Plan Cancer) have directed significant funding to colorectal cancer research and patient care.
- Comprehensive public awareness campaigns are run by INCa (French National Cancer Institute).

Opportunity

- 0

- Disparities in treatment outcomes between urban and rural or lower-income populations still exist.
- Low participation in clinical trials among older adults and rural populations.

- France's leadership in European cancer research initiatives can drive further colorectal cancer innovations.
- Public-private partnerships can strengthen trial outreach and awareness efforts.

- Post-pandemic budget constraints may limit campaign funding or delay research rollouts.
- Misinformation or screening fatigue may affect public response to awareness programs.

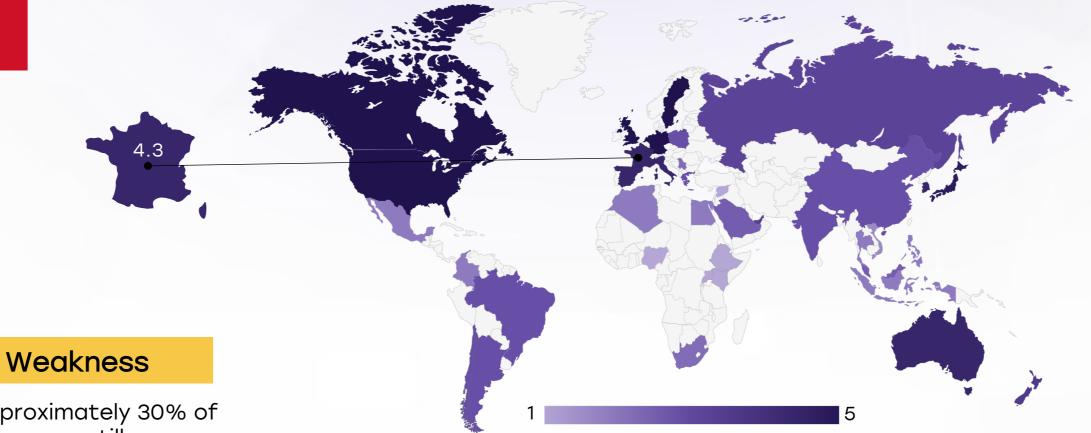

- 5. Strong healthcare infrastructure with comprehensive treatment access, high research funding, and nationwide awareness campaigns. Patients have access to advanced therapies, clinical trials, and widespread early detection programs.
- 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
- 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
- 2. Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
- 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Survival Rates, Early **Detection** and Palliative Care

Strengths

- 5-year survival rate for colorectal cancer is around 63-65% due to early diagnosis and high treatment quality.
- Integrated palliative care services are widely available in tertiary and many regional centers.

0

- Approximately 30% of cases are still diagnosed at late stages, especially among those who skip
- Early palliative interventions are underutilized due to delayed referrals or clinician hesitancy.

screening.

Opportunity

- Enhancing primary care engagement in early symptom recognition and urgent referrals.
- Expansion of home-based palliative models and digital monitoring.

- Increasing cancer burden with France's aging population could stretch current service capacity.
- Persistent screening hesitancy in some communities could reduce early-stage diagnoses.

- 5. High survival rates, strong early detection programs, and well-established palliative care services. Patients have access to timely diagnosis, advanced treatments, and comprehensive end-oflife care.
 - 4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.
 - 3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life care.
 - 2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.
 - 1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Utilization of Biomarkers

Strengths

- Routine use of KRAS and NRAS testing for metastatic colorectal cancer; MSI testing is integrated for immunotherapy decisions.
- BRAF V600E mutation and PIK3CA testing are increasingly applied to guide targeted therapy and prognosis.

Opportunity

- National programs can further standardize biomarker reporting and precision medicine implementation.
- Ongoing trials involving biomarker-driven therapy (e.g., anti-EGFR, BRAF inhibitors) can shape treatment pathways.

Weakness

- Turnaround times for biomarker testing can vary by region due to lab processing capacities.
- Some community hospitals may need to refer samples to central labs, causing delays.

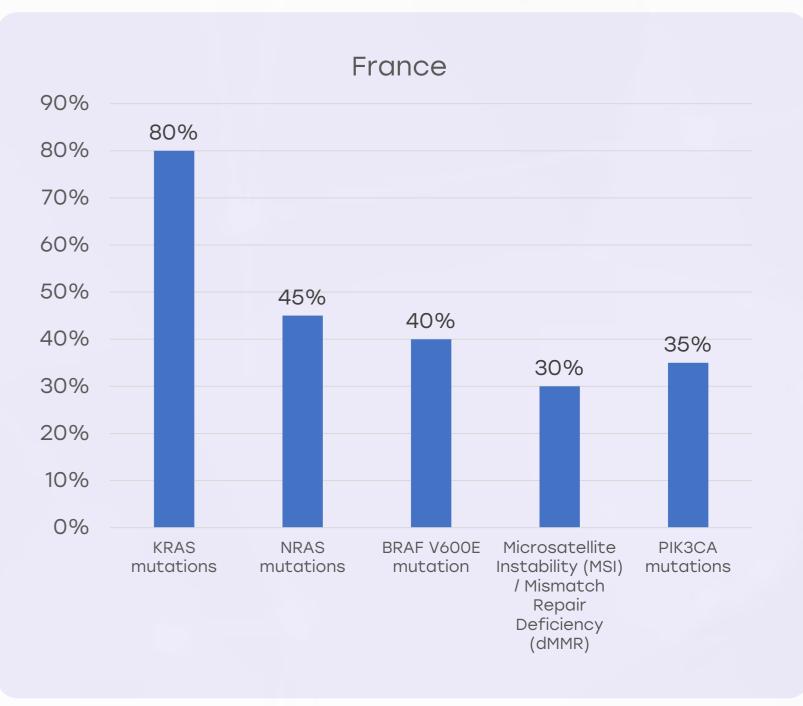

Threats

- Over-reliance on a few centralized labs may cause bottlenecks.
- Cost of expanding multigene panels may challenge the public health insurance model.

Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.

Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.

Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

Clinical Guidelines

Strengths

- France has wellestablished national guidelines for colorectal cancer through INCa and HAS.
- Regular updates incorporate the latest ESMO/ASCO recommendations, adapted for national context.

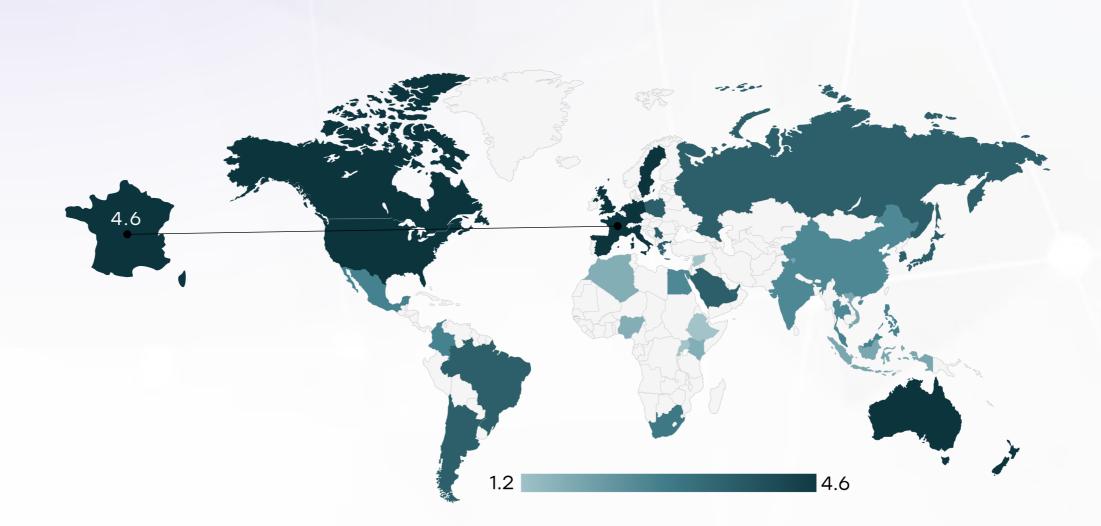

Opportunity

- Development of digital clinical decision tools to enhance physician adherence.
- Inclusion of patientreported outcomes in guidelines for holistic care.

Weakness

- Sometimes slow adaptation of global guidelines into realworld clinical practice, especially in community hospitals.
- Complexity of guidelines can pose challenges for general practitioners managing early-stage disease.

- Continuous updates require consistent training and dissemination; otherwise, guideline fatigue may set in.
- Resource variation may limit guideline uniformity in practice.

Reimbursement

Strengths

- France's social security system covers the majority of cancer diagnostics and treatments, including molecular tests and biologics.
- Patients with colorectal cancer are typically classified under ALD (Long-Term Conditions) status, ensuring full reimbursement.

Opportunity

- HTA reforms and fasttrack pathways for highimpact oncology therapies.
- Expansion of reimbursement for homebased chemotherapy and supportive care.

Weakness

- New or off-label therapies may take months to gain reimbursement approval.
- Administrative burden and delays in processing reimbursement for innovative treatments.

- Budget tightening across Europe may affect drug pricing and access in the medium term.
- Disparities between private and public sector timelines for drug access could widen.

- A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or public-private partnerships. Patients face no direct financial burden.
- A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

Colorectal Cancer Screening

Strengths

- National organized colorectal cancer screening program using FIT is available for adults aged 50-74.
- Participation is incentivized through primary care involvement and reminders.

Opportunity

- Targeted digital and community outreach programs can drive up screening rates.
- Piloting earlier screening for individuals with family history or genetic predisposition.

Weakness

 Screening participation remains suboptimal (~35-40%), far below the EU target of 65%.

W

0

 Limited engagement in vulnerable populations and those with language or cultural barriers.

- Delayed follow-up colonoscopies postpositive FIT due to capacity issues.
- Public apathy and low perceived risk continue to undermine screening efforts.

Country	Colorectal Cancer Screening
United States	Annual LDCT (50-80 years, high-risk smokers)
United Kingdom	LDCT for high-risk individuals (55-74 years)
Canada	LDCT for high-risk individuals (55-74 years)
Australia	No national program, high-risk groups advised LDCT
Germany	No national program, under evaluation
France	No national LDCT screening
Netherlands	Participating in European screening studies
Sweden	No national LDCT screening
Italy	Regional pilot LDCT screening
Spain	No national LDCT program
Poland	No national program
Japan	No national LDCT program
South Korea	LDCT for high-risk individuals (50-74 years)
China	No national LDCT program
India	No national LDCT program
Singapore	No national LDCT program
Saudi Arabia	No national LDCT program; some hospital-based opportunistic screening
UAE	No national LDCT program; early-stage pilot studies ongoing in select hospitals
Syria	No national LDCT program; screening not prioritized due to conflict
Malaysia	No program; high-risk CT pilots

Country	Colorectal Cancer Screening
Thailand	No national LDCT program
South Africa	No national LDCT program
Kenya	No national LDCT program
Nigeria	No national LDCT program
Egypt	No national LDCT program
Morocco	No national LDCT program
Algeria	No national LDCT program
Ethiopia	No national LDCT program
Mexico	No national LDCT program
Brazil	No national LDCT program
Argentina	No national LDCT program
Chile	No national LDCT program
Colombia	No national LDCT program
New Zealand	No national LDCT program
Greece	No national LDCT program
Rwanda	No national LDCT program
Uganda	No national LDCT program
Serbia	No national LDCT program
Indonesia	No national LDCT program; opportunistic screening in private sector
Vietnam	No national LDCT program; early pilot screening studies in Hanoi and Ho Chi Minh
Philippines	No national LDCT program; feasibility and awareness programs under discussion
Russia	No formal national LDCT program; regional pilot screening programs in large cities
