

Colorectal Cancer Factsheet: Insights & Key Developments

Key Insights on Colorectal Cancer Care and Infrastructure

Core Pillars:

- Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Colorectal Cancer Screening

Colorectal cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping colorectal cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

- Incidence share: Colorectal cancer is in the top 3 male cancers.
- Incidence rate: Around 42 per 100,000 men per year.
- Total new cases (2022): Approximately 3,300 men.
- Daily diagnoses (2022): About 9 men per day.
- Deaths (2022): Around 2,000 men.
- 5-year survival rate: Estimated 45-50%.
- Most affected age group: Primarily 60 and older.
- · Screening participation: National screening program exists, but participation is limited

Serbia -

0

Infrastructure

Strengths

- Presence of national cancer centers such as the Institute for Oncology and Radiology of Serbia (IORS) with molecular pathology and surgical capabilities.
- Government efforts to centralize specialized oncology services.

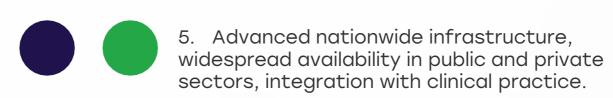

Opportunity

- EU-backed investments for medical equipment modernization.
- Expansion of cancer care networks outside Belgrade.

Weakness

- Regional disparity in oncology services; rural populations face limited access to diagnostics and treatment.
- Outdated equipment in some secondary hospitals.

- Emigration of healthcare professionals affects system capacity.
- Limited interoperability of medical records hinders coordinated care.

- 4. Strong infrastructure in major hospitals and cancer centers, some regional disparities.
- 3. Moderate infrastructure, primarily in private settings or research institutions.
- 2. Limited infrastructure, available only in select centers or for high-cost private testing.
 - 1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Treatment Access, Research Funding and Awareness Campaigns

Strengths

- CRC treatment is covered under Serbia's universal health system.
- Local NGOs and cancer societies conduct annual awareness 0 campaigns for CRC prevention.

Weakness

- Research capacity for clinical trials and molecular oncology is underdeveloped.
- Public awareness remains low in rural communities.

Opportunity

- EU research collaboration programs offer funding and training for oncology researchers.
- Scaling up educational campaigns in primary healthcare.

- Underfunding of public research institutions.
- Low participation in global CRC clinical research initiatives.

- 5. Strong healthcare infrastructure with comprehensive treatment access, high research funding, and nationwide awareness campaigns. Patients have access to advanced therapies, clinical trials, and widespread early detection programs.
- 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
- 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
- 2. Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
- 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Survival Rates, Early **Detection** and **Palliative Care**

Wed

S

0

W

 Early detection improves CRC survival rate to over 60% when identified in stages I-II.

Strengths

 Access to hospitalbased palliative care in large cities like Belgrade and Novi Sad.

 Promote early diagnosis through integration into primary care visits.

Opportunity

 Develop national hospice care standards and training.

• Many Cl diagnosed at advanced stages due to late screening or diagnosis.

 Home-based and rural palliative services are insufficient.

Threats

- High burden of noncommunicable diseases competes for attention and funding.
- Lack of trained palliative care professionals across the system.

5. High survival rates, strong early detection programs, and well-established palliative care services. Patients have access to timely diagnosis, advanced treatments, and comprehensive end-oflife care.

> 4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.

> > 3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life care.

2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.

1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Serbia -Utilization of Biomarkers

2.6

Strengths

- Testing for KRAS, NRAS, and MSI is conducted in select tertiary institutions for guiding therapy.
- Adoption of biomarker testing for advanced and metastatic CRC patients.

Weakness

- Testing remains centralized and not uniformly accessible.
- Physicians in peripheral centers may lack training in biomarker-driven decisions.

W

0

Opportunity

- Integration of molecular testing into routine CRC diagnostic pathways.
- Government or donor-funded expansion of molecular labs in regional centers

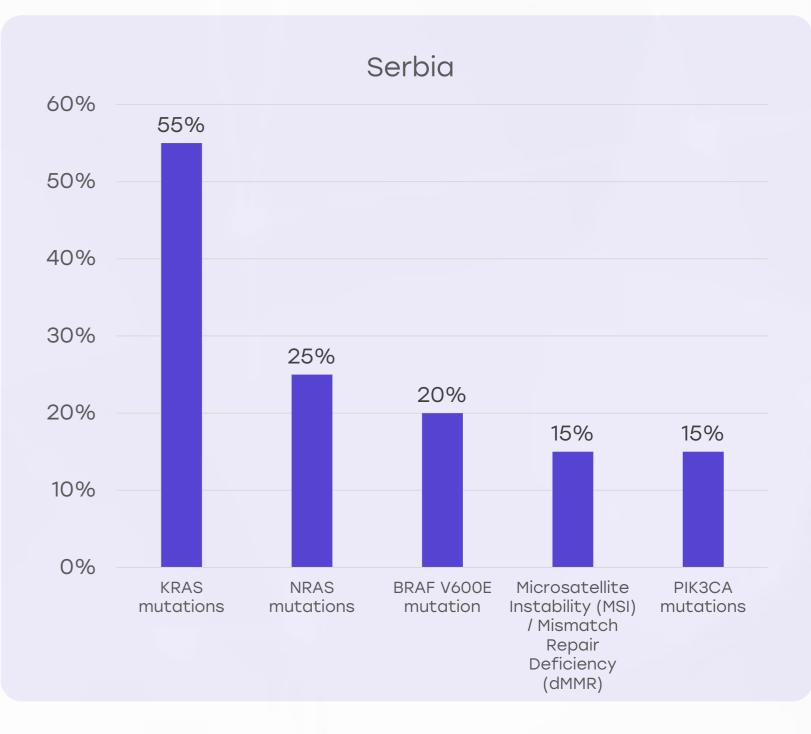

Threats

- High cost of molecular assays limits routine use outside capital.
- Delays in reimbursement for genomic tests slow adoption.

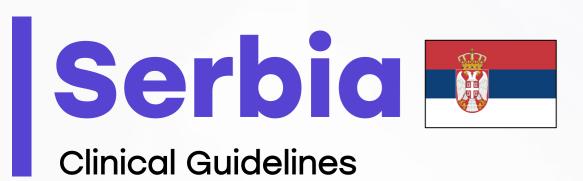

Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.

Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.

Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

Strengths

- Serbia follows adapted European Society for Medical Oncology (ESMO) and WHO guidelines.
- National CRC screening and management protocol exists.

0

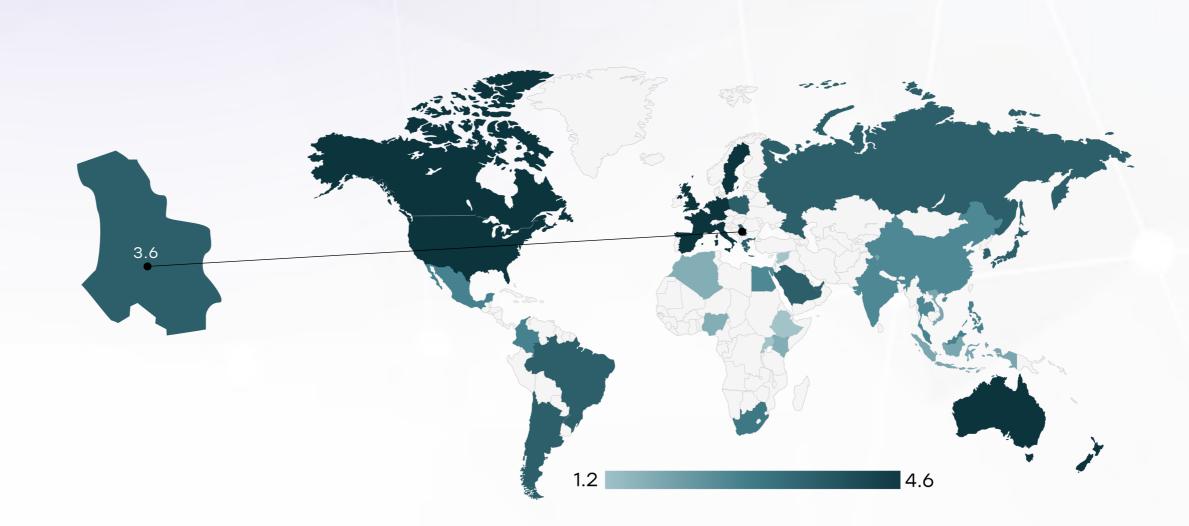

Opportunity

- Digitize and disseminate updated protocols via e-health platforms.
- Training workshops on guideline adherence for all levels of providers.

Weakness

- Implementation gaps between urban and rural areas.
- Guidelines not regularly updated to reflect rapid biomarker advancements.

- Lack of funding and administrative inertia slows revision and dissemination.
- Variability in practice patterns leads to treatment inconsistency.

	Very High	High	Medium	Low	Very Low

Feasibility of Integration	*	0	*	*	*
Adoption of International Guidelines	*	0	*	*	*
Engagement with Updates	*	*	0	*	*
ESMO Guidelines Implementation	*	0	*	*	*

Strengths

- National Health Insurance Fund (RFZO) covers most CRC treatment and diagnostics.
- Basic chemotherapy and radiation therapies reimbursed in full.

Opportunity

- Negotiate bulk pricing for advanced diagnostics (e.g., MSI, NGS panels) to widen access.
- Improve publicprivate partnerships to extend insurance benefits.

Weakness

- Delays in adding new targeted therapies or tests to reimbursement lists.
- Reimbursement process lacks transparency and may involve bureaucratic delays.

W

0

- Rising cost of novel therapies may strain public insurance funds.
- Economic constraints may deprioritize preventive care reimbursements.

- A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or public-private partnerships. Patients face no direct financial burden.
- A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

S

0

Strengths

- National CRC screening program launched targeting people aged 50-74 using FIT tests.
- Pilot programs have improved participation in selected municipalities.

Opportunity

- Scale-up communitybased awareness and navigation programs.
- Integrate CRC screening into electronic health records to improve tracking.

Weakness

- Nationwide coverage and compliance remain low (~20-25%).
- Follow-up colonoscopy rates after positive FITs are inconsistent.

- Public mistrust in preventive procedures.
- Logistical bottlenecks in colonoscopy availability reduce screening effectiveness.

Country	Colorectal Cancer Screening
United States	Annual LDCT (50-80 years, high-risk smokers)
United Kingdom	LDCT for high-risk individuals (55-74 years)
Canada	LDCT for high-risk individuals (55-74 years)
Australia	No national program, high-risk groups advised LDCT
Germany	No national program, under evaluation
France	No national LDCT screening
Netherlands	Participating in European screening studies
Sweden	No national LDCT screening
Italy	Regional pilot LDCT screening
Spain	No national LDCT program
Poland	No national program
Japan	No national LDCT program
South Korea	LDCT for high-risk individuals (50-74 years)
China	No national LDCT program
India	No national LDCT program
Singapore	No national LDCT program
Saudi Arabia	No national LDCT program; some hospital-based opportunistic screening
UAE	No national LDCT program; early-stage pilot studies ongoing in select hospitals
Syria	No national LDCT program; screening not prioritized due to conflict
Malaysia	No program; high-risk CT pilots

Country	Colorectal Cancer Screening
Thailand	No national LDCT program
South Africa	No national LDCT program
Kenya	No national LDCT program
Nigeria	No national LDCT program
Egypt	No national LDCT program
Morocco	No national LDCT program
Algeria	No national LDCT program
Ethiopia	No national LDCT program
Mexico	No national LDCT program
Brazil	No national LDCT program
Argentina	No national LDCT program
Chile	No national LDCT program
Colombia	No national LDCT program
New Zealand	No national LDCT program
Greece	No national LDCT program
Rwanda	No national LDCT program
Uganda	No national LDCT program
Serbia	No national LDCT program
Indonesia	No national LDCT program; opportunistic screening in private sector
Vietnam	No national LDCT program; early pilot screening studies in Hanoi and Ho Chi Minh
Philippines	No national LDCT program; feasibility and awareness programs under discussion
Russia	No formal national LDCT program; regional pilot screening programs in large cities
