

Breast Cancer Factsheet: Insights & Key Developments

Key Insights on Breast Cancer Care and Infrastructure

Core Pillars:

- 1. Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Breast Cancer Screening

Breast cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping breast cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

- Breast cancer incidence: ~56,800 new cases annually (~150 per day).
- Gender distribution: ~56,400 women and ~390 men diagnosed each year.
- Lifetime risk: 1 in 7 women in the UK.
- Age group most affected: 80% of cases occur in women over 50.
- Annual deaths: ~11,500 (32 per day), including ~11,400 women and ~85 men.
- Mortality rate: 48% of deaths occur in those aged 75+.
- Survival rate: 5-year survival ~85%.
- Decline in mortality: 41% decrease since the 1970s.
- Geographic distribution of cases:
 - England: ~46,000 cases annually.
 - Scotland: ~4,800 cases annually.
 - Wales: ~2,600 cases annually.
 - Northern Ireland: ~1,500 cases annually.
- Prevalence (2021): 2.1% for females, 0.009% for males.

Infrastructure

Strengths

- National network of NHS-designated cancer centers.
- HER2 and BRCA testing widely available via Genomic Medicine Service.

s W O T

Weakness

 Rural areas face longer turnaround times for molecular test results.

Opportunity

 Expand digital pathology and genomic testing capacity.

Threats

 Regional disparities in diagnostic speed may affect equity.

5. Advanced nationwide infrastructure, widespread availability in public and private sectors, integration with clinical practice.

 Moderate infrastructure, primarily in private settings or research institutions.

2. Limited infrastructure, available only in select centers or for high-cost private testing.

1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Treatment Access, Research Funding and Awareness Campaigns

Strengths

- Universal NHS access to HER2 therapies, including trastuzumab and Enhertu.
- Active research and strong charity investment.

Weakness

 Access may vary across NHS Trusts and nations (e.g., SMC vs NICE).

Opportunity

 Harmonize approvals and expand awareness of secondary breast cancer.

Threats

 Regional or policy delays in adopting new therapies may persist.

- 5. Strong healthcare infrastructure with comprehensive treatment access, high research funding, and nationwide awareness campaigns. Patients have access to advanced therapies, clinical trials, and widespread early detection programs.
- 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
- 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
- Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
- 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Survival Rates, Early **Detection** and **Palliative Care**

Strengths

- >85% 5-year survival; over 70% diagnosed early.
- Hospice and community palliative care widely available.

Weakness

 Survival gaps across socioeconomic groups.

0

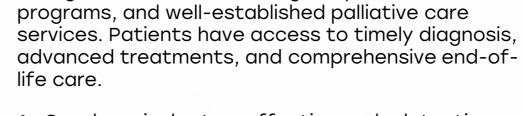

Opportunity

 Strengthen outreach to deprived communities and ethnic minorities.

Threats

 Continued data gaps on secondary/metastatic breast cancer.

5. High survival rates, strong early detection

4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.

3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life

2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.

1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Utilization of Biomarkers

Strengths

- Nearly all invasive cancers undergo HER2, ER, PR testing.
- HER2-low classification now included in national guidelines.

0

Weakness

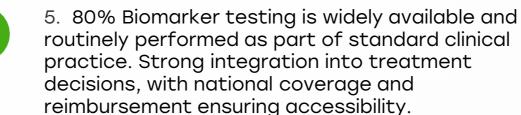

• Turnaround times and biomarker re-testing may vary regionally.

Opportunity

 Improve reflex testing for HER2-low and metastases.

Threats

• HER2 status discordance may impact treatment selection.

- 4. 61-80%. Biomarker testing is commonly used, but access may be limited in certain regions or patient groups. Some disparities exist in coverage or affordability, but it is still a crucial part of cancer diagnostics
- 3. 41-60% Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.
- 2. 20-40% Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.
- 1. <20% Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

HER2

ER

BRCA2

BRCA1

Clinical Guidelines

Strengths

 NICE and regional guidelines regularly updated; align with ESMO and ASCO.

s w

Weakness

 Variable implementation pace in smaller or less resourced units.

Opportunity

 Strengthen national audit and training programs.

Threats

 Delayed uptake of new evidence in decentralized regions.

	Very High	High	Medium	Low	Very Low
Clinical Guideline Implementation	0	*	*	*	*
Feasibility of Integration	0	*	*	*	*
Adoption of International Guidelines	0	*	*	*	*
Engagement with Updates	*	0	*	*	*
ESMO Guidelines Implementation	0	*	*	*	*

Reimbursement

Strengths

 NHS provides nocost access to all standard HER2 treatments.

Weakness

 Economic data on real-world HER2 costs still limited.

Opportunity

 Expand funding for diagnostics like liquid biopsy.

Threats

 NHS budget pressures may affect future access to newer agents.

- Yes A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or public-private partnerships. Patients face no direct financial burden.
- Partial A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

Breast Cancer Screening

0

Strengths

NHSBSP screens
2.5M+ women every
3 years; Al integration underway.

Weakness

 Participation varies by region; ~39% caught at Stage I.

Opportunity

 Extend age range and digitize follow-up pathways.

Threats

 Uptake still lower among deprived and minority populations.

Country	Breast Cancer Screening
United States	Biennial mammograms (50-74 years)
United Kingdom	Triennial mammograms (50-71 years)
Canada	Mammograms every 2-3 years (50-74 years)
Australia	Biennial mammograms (50-74 years)
Germany	Mammograms every 2 years (50-69 years)
France	Biennial mammograms (50-74 years)
Netherlands	Mammograms every 2 years (50-75 years)
Sweden	Mammograms every 18-24 months (40- 74 years)
Italy	Mammograms every 2 years (50-69 years)
Spain	Mammograms every 2 years (50-69 years)
Poland	Mammograms every 2 years (50-69 years)
Japan	Mammograms every 2 years (40+ years)
South Korea	Biennial mammograms (40+ years)
China	Regional mammogram programs (40-69 years)
India	Opportunistic screening
Singapore	Biennial mammograms (50-69 years)
Saudi Arabia	Opportunistic screening; regional programs for women aged 40+
UAE	Opportunistic screening; encouraged every 2 years for 40-69 years
Syria	No national program; limited local initiatives due to conflict

Country	Breast Cancer Screening
Thailand	Biennial mammograms (50-69 years)
South Africa	Opportunistic screening
Kenya	No national program
Nigeria	No national program
Egypt	National awareness campaigns
Morocco	National program for 45-69 years
Algeria	Planned national program (50-69 years)
Ethiopia	No national program
Mexico	Biennial mammograms (40-69 years)
Brazil	Biennial mammograms (50-69 years)
Argentina	Biennial mammograms (50-69 years)
Chile	Mammograms every 3 years (50-69 years)
Colombia	Biennial mammograms (50-69 years)
New Zealand	Biennial mammograms (45-69 years)
Greece	Biennial mammograms (50-69 years)
Rwanda	No national program
Uganda	No national program
Serbia	Biennial mammograms (50-69 years)
Indonesia	Opportunistic screening; no national mammography program
Vietnam	Regional mammography programs; pilot programs in urban areas (age 45-69)
Philippines	Opportunistic screening; mammography recommended every 2 years for women 50+
Russia	National program for biennial mammograms (50-69 years)
