

Gastric Cancer Factsheet: Insights & Key Developments

Key Insights on Gastric Cancer Care and Infrastructure

Core Pillars:

- 1. Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Gastric Cancer Screening

Gastric cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping Gastric cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

- Incidence share: Gastric cancer ranks around 15th-20th in men.
- Incidence rate: Approximately 5 per 100,000 men per year.
- Total new cases (2022): Estimated ~4,100 cases in men, ~8,200 both sexes.
- Daily diagnoses: ≈ 11 men per day.
- Deaths (2022): Around 4,900 deaths (evidently close to total across both sexes).
- 5-year survival rate: Roughly 30-40%.
- Most affected age group: Men aged 70+.
- Screening participation: No organized screening; most cases discovered symptomatically.

Infrastructure

Strengths

- Advanced oncology infrastructure through publicly funded systems like Cancer Care Ontario and BC Cancer Agency.
- Access to highresolution endoscopy, molecular pathology, and comprehensive cancer centres in all provinces.

Opportunity

- Expansion of virtual oncology care and telepathology for rural support.
- Federal investment through the Pan-Canadian Health Data Strategy could streamline cancer diagnostics and data sharing.

Weakness

- Long wait times for diagnostic endoscopy in public systems.
- Disparities in infrastructure between urban and remote/rural/Indigeno us communities, particularly in the northern territories.

- Aging infrastructure and rising cancer incidence may overburden current capacity.
- Dependence on provincial-level budgeting slows unified expansion of services

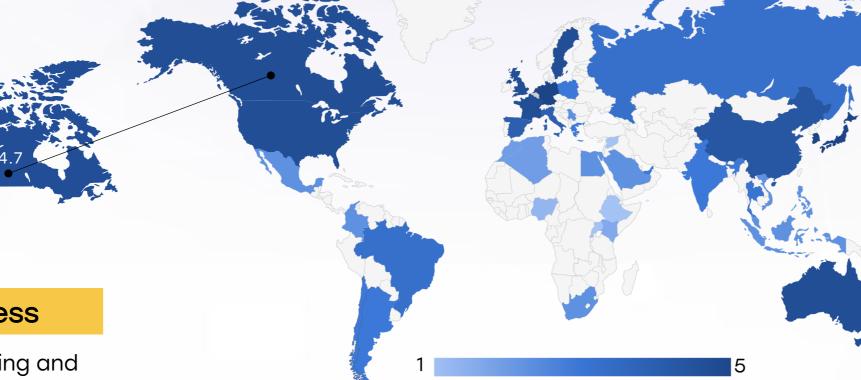

- 5. Advanced nationwide infrastructure, widespread availability in public and private sectors, integration with clinical practice.
- 4. Strong infrastructure in major hospitals and cancer centers, some regional disparities.
- 3. Moderate infrastructure, primarily in private settings or research institutions.
- 2. Limited infrastructure, available only in select centers or for high-cost private testing.
- 1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Treatment Access, Research Funding and Awareness Campaigns

Strengths

- Strong national cancer control strategy via Canadian Partnership Against Cancer (CPAC) and funding bodies like CIHR.
- Several GC clinical trials underway, including biomarker-driven and immunotherapy-based studies.

0

Weakness

- Limited funding and advocacy for GC compared to more common cancers (breast, prostate, lung).
- Lower public awareness of GC symptoms contributes to delayed diagnoses.

Opportunity

- Increased collaboration between academic centres and global trials (e.g., CheckMate, DESTINY-Gastric) to bring therapies faster.
- Bilingual (English/French) public health campaigns focused on H. pylori, dietary risk, and early symptom awareness.

- Provincial variability in access to advanced therapies.
- Low visibility of gastric cancer in mainstream cancer campaigns

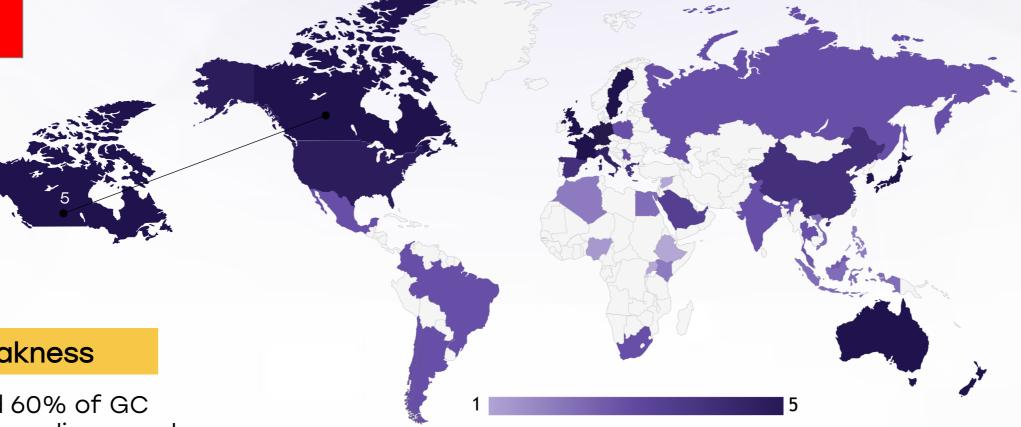

- 5. Strong healthcare infrastructure with comprehensive treatment access, high research funding, and nationwide awareness campaigns. Patients have access to advanced therapies, clinical trials, and widespread early detection programs.
- 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
- 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
- 2. Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
- 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Canada +

Survival Rates, Early **Detection** and Palliative Care

Strengths

- Canada maintains one of the highest palliative care access indices globally.
- Five-year survival for localized GC cases is high (~65%) when caught early.

0

Weakness

- Around 60% of GC cases are diagnosed at advanced stages, lowering overall 5year survival to ~28%.
- Early detection is hampered by lack of routine upper GI screening.

Opportunity

- Targeted early detection programs for high-risk groups (e.g., East Asian, Indigenous, or Latin American descent).
- Enhanced use of H. pylori screening and treatment programs to prevent progression.

- **Threats**
- Misdiagnosis or underrecognition of GC symptoms in primary care settings.
- Growing elderly population raises demand on supportive and palliative care systems.

- 5. High survival rates, strong early detection programs, and well-established palliative care services. Patients have access to timely diagnosis, advanced treatments, and comprehensive end-oflife care.
- 4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.
- 3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life care.
- 2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.
- 1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Utilization of Biomarkers

Strengths

- HER2 and PD-L1 testing is standard for advanced GC cases in tertiary care centres.
- MSI-H/dMMR testing is increasingly applied due to relevance across multiple GI cancers.

Opportunity

- Integration of biomarker testing into precision oncology pathways under Canada's Pan-Canadian Oncology Drug Review (pCODR).
- National registry and data standardization could improve biomarker utility tracking.

Weakness

- Limited availability of advanced biomarkers (e.g., CLDN18.2, FGFR2b) outside clinical trial settings.
- Inconsistent biomarker reporting and uptake between provinces.

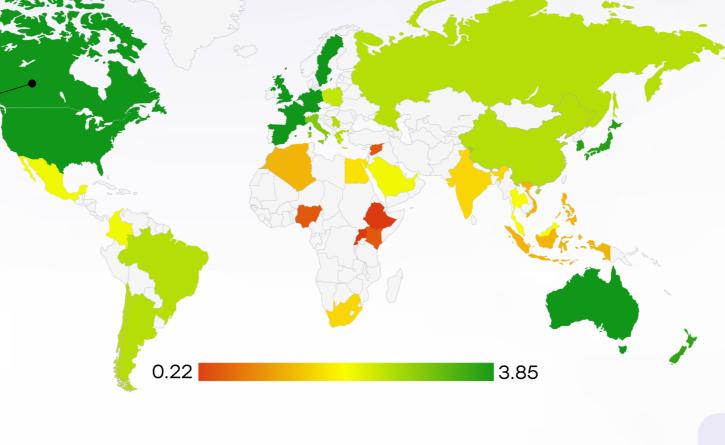

Threats

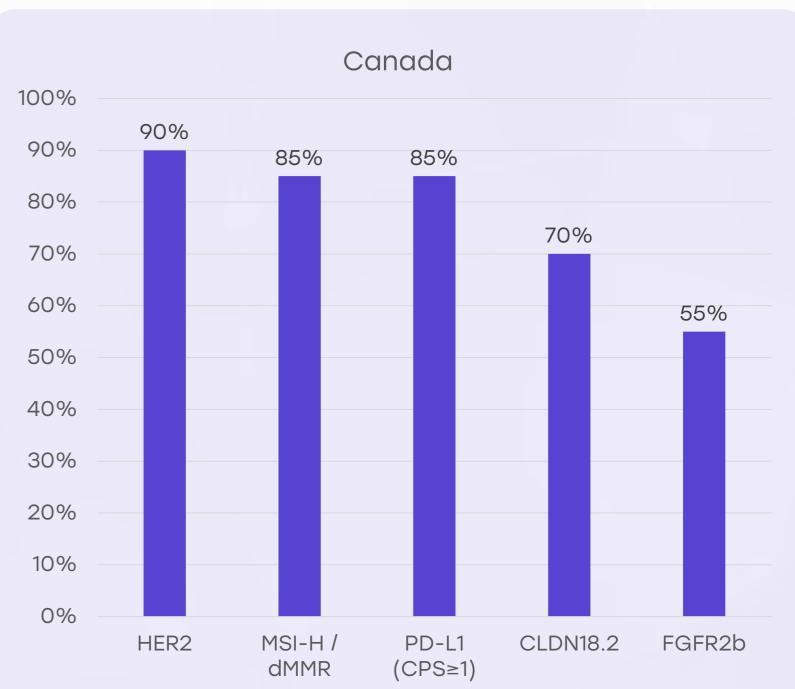

- Delays in biomarker approval and reimbursement deter adoption in public systems.
- Economic constraints could limit broad access to testing in underserved regions.

Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.

Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.

Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

Canada

0

Clinical Guidelines

Strengths

- Canadian guidelines (e.g., via Cancer Care Ontario and BC Cancer) are evidence-based and align with global standards.
- Guidelines include HER2 testing and trastuzumab-based treatment for metastatic GC.

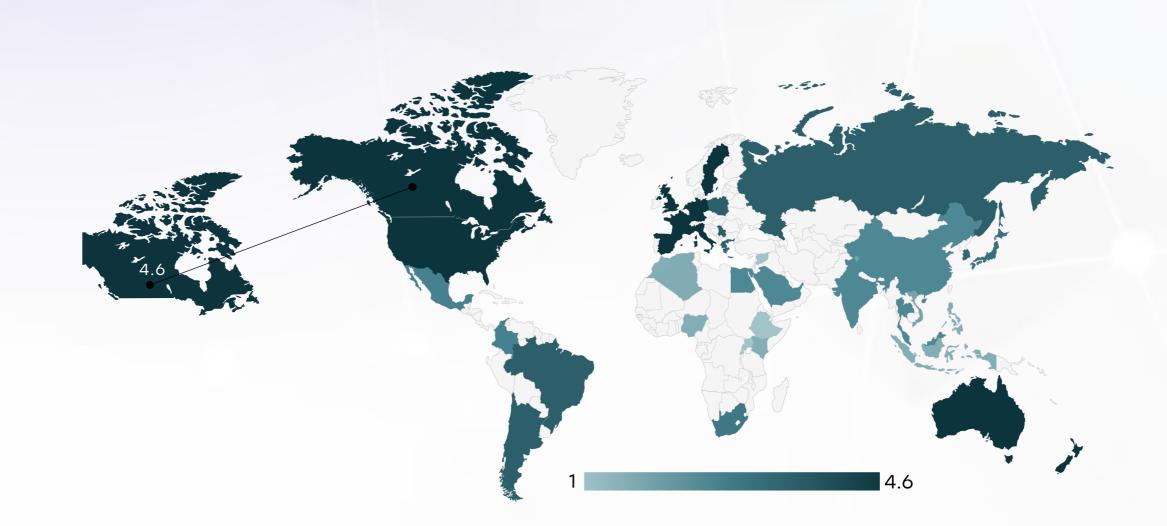

Opportunity

- Update national GC treatment guidelines to include immunotherapy and targeted therapy protocols.
- National expert working group to standardize GC biomarker management.

Weakness

- Lack of inclusion for newer biomarkers (CLDN18.2, FGFR2b) and their related therapies.
- Variable implementation of guidelines depending on provincial infrastructure and policies.

- Fragmentation of provincial guidelines may cause inconsistency in care delivery.
- New guideline adoption can be slow due to decentralized healthcare governance.

	Very High	High	Medium	Low	Very Low

Reimbursement

Strengths

- Universal public healthcare system covers standard chemotherapy and surgical treatment for GC.
- Drugs like trastuzumab and nivolumab have been approved and reimbursed for HER2+ and PD-L1+ patients respectively in certain cases.

Opportunity

- Accelerated review pathways and real-world evidence could support reimbursement of innovative GC therapies.
- Health Technology
 Assessment (HTA) reforms
 may streamline drug
 access timelines.

Weakness

- Reimbursement for novel agents like zolbetuximab or FGFR2b inhibitors is not yet standardized.
- Delays between Health Canada approval and provincial reimbursement listing.

- Budget constraints and high drug costs hinder rapid adoption.
- Equity issues arise between public vs private insurance holders, especially for biomarker testing.

- A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or public-private partnerships. Patients face no direct financial burden.
- A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

Gastric Cancer Screening

Strengths

- Targeted H. pylori screening programs exist in some provinces (e.g., British Columbia).
- Indigenous health programs have integrated GI symptom screening into broader chronic disease checks.

Opportunity

- Screening initiatives for high-risk immigrants (from East Asia, Latin America, or Eastern Europe).
- H. pylori testing and eradication could be scaled through primary care networks.

Weakness

- No national or provinciallevel population-based GC screening program.
- Low public awareness about H. pylori, atrophic gastritis, or family history risks.

- GC screening not prioritized due to overall lower incidence compared to other cancers.
- Over-reliance on symptomatic endoscopy delays early detection.

Country	Gastric Cancer Screening
United States	Annual LDCT (50-80 years, high-risk smokers)
United Kingdom	LDCT for high-risk individuals (55-74 years)
Canada	LDCT for high-risk individuals (55-74 years)
Australia	No national program, high-risk groups advised LDCT
Germany	No national program, under evaluation
France	No national LDCT screening
Netherlands	Participating in European screening studies
Sweden	No national LDCT screening
Italy	Regional pilot LDCT screening
Spain	No national LDCT program
Poland	No national program
Japan	No national LDCT program
South Korea	LDCT for high-risk individuals (50-74 years)
China	No national LDCT program
India	No national LDCT program
Singapore	No national LDCT program
Saudi Arabia	No national LDCT program; some hospital-based opportunistic screening
UAE	No national LDCT program; early-stage pilot studies ongoing in select hospitals
Syria	No national LDCT program; screening not prioritized due to conflict
Malaysia	No program; high-risk CT pilots

Country	Gastric Cancer Screening
Thailand	No national LDCT program
South Africa	No national LDCT program
Kenya	No national LDCT program
Nigeria	No national LDCT program
Egypt	No national LDCT program
Morocco	No national LDCT program
Algeria	No national LDCT program
Ethiopia	No national LDCT program
Mexico	No national LDCT program
Brazil	No national LDCT program
Argentina	No national LDCT program
Chile	No national LDCT program
Colombia	No national LDCT program
New Zealand	No national LDCT program
Greece	No national LDCT program
Rwanda	No national LDCT program
Uganda	No national LDCT program
Serbia	No national LDCT program
Indonesia	No national LDCT program; opportunistic screening in private sector
Vietnam	No national LDCT program; early pilot screening studies in Hanoi and Ho Chi Minh
Philippines	No national LDCT program; feasibility and awareness programs under discussion
Russia	No formal national LDCT program; regional pilot screening programs in large cities
