

# Gastric Cancer Factsheet: Insights & Key Developments

Key Insights on Gastric Cancer Care and Infrastructure

# Core Pillars:

- Infrastructure
- 2. Treatment Access, Research Funding and Awareness Campaigns
- 3. Survival Rates, Early Detection and Palliative Care
- 4. Utilization of Biomarkers
- 5. Clinical Guidelines
- 6. Reimbursement
- 7. Gastric Cancer Screening

Gastric cancer remains one of the most prevalent cancers worldwide, affecting millions of individuals each year. Despite advancements in diagnostics, treatment, and awareness, disparities in access to care, molecular testing, and specialized centers persist.

This factsheet provides a comprehensive overview of key pillars shaping Gastric cancer care, including specialized infrastructure, treatment accessibility, research funding, early detection, and palliative care.

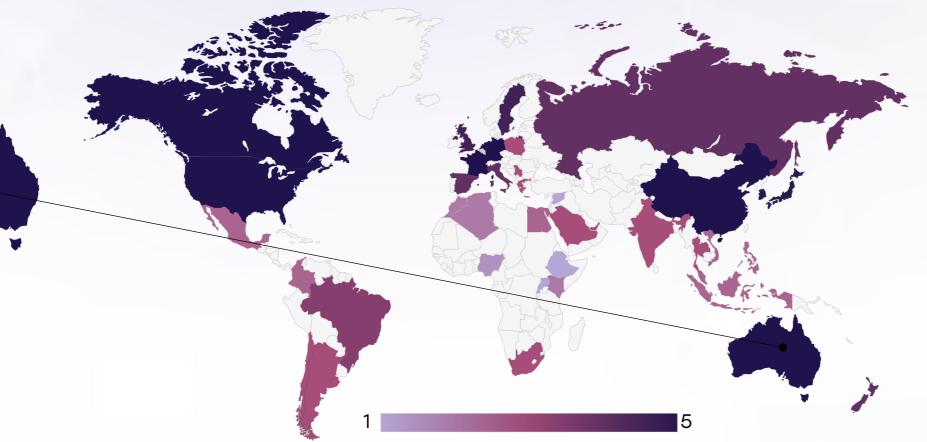

- Incidence share: Gastric cancer ranks around the 15th-20th most common in men.
- Incidence rate: Approximately 3 per 100,000 men per year.
- Total new cases (2022): Estimated ~2,800-3,300 cases (both sexes).
- Daily diagnoses: ≈ 7–9 people per day.
- Deaths (2022): Around ~1,300 deaths.
- 5-year survival rate: Estimated 40-50%, reflecting moderate-stage diagnosis.
- Most affected age group: Incidence highest in men aged 70+.
- · Screening participation: No national screening; detection is often incidental or symptombased.

Infrastructure

# Strengths

- World-class cancer centres like Peter MacCallum Cancer Centre and Chris O'Brien Lifehouse offer advanced diagnostics, molecular testing, and surgical oncology.
- Tele-oncology and remote specialist consultations improve access in rural and Indigenous communities.

# Opportunity

- Expansion of digital health platforms and remote diagnostic capabilities.
- Government investments in regional cancer centres (e.g., Regional Cancer Centre Initiative).

### Weakness

- Disparities remain in access to GI oncology infrastructure across rural and Indigenous populations.
- Some regional hospitals lack full molecular pathology services and advanced endoscopic techniques.

- Workforce shortages in rural regions limit access to timely gastric cancer care.
- Rising cancer burden may strain high-volume oncology centres.

- 5. Advanced nationwide infrastructure, widespread availability in public and private sectors, integration with clinical practice.
- 4. Strong infrastructure in major hospitals and cancer centers, some regional disparities.
- Moderate infrastructure, primarily in private settings or research institutions.
- 2. Limited infrastructure, available only in select centers or for high-cost private testing.
- 1. Minimal or no infrastructure, testing mostly unavailable or sent abroad.

Treatment Access, Research Funding and Awareness Campaigns

0

## Strengths

- High public funding for cancer treatment through Medicare ensures equitable access to chemotherapy and targeted therapies.
- Australia participates in global clinical trials for gastric cancer (e.g., HER2 and FGFR2b inhibitor studies).

# Opportunity

- National Cancer
  Research Centres and
  cooperative groups can
  drive biomarker-specific
  trials.
- Targeted awareness campaigns can be developed for high-risk groups such as East Asian immigrants.

### Weakness

- Newer immunotherapies and biomarkers are subject to delayed approval and limited public access.
- Gastric cancer receives lower awareness and research funding compared to colorectal, breast, and prostate cancers.

- Budget constraints in the Pharmaceutical Benefits Scheme (PBS) delay listing of high-cost immunotherapies.
- Low public awareness hinders early detection.

- 5. Strong healthcare infrastructure with comprehensive treatment access, high research funding, and nationwide awareness campaigns. Patients have access to advanced therapies, clinical trials, and widespread early detection programs.
- 4. Well-developed system with good treatment availability, strong research funding, and effective but regionally focused awareness campaigns. Some disparities may exist in rural areas or between public and private sectors.
- 3. Moderate development, with specialized treatments available in major hospitals, research funding concentrated on specific cancers, and occasional but limited awareness efforts. Healthcare access may be restricted by cost or geography.
- Limited system where cancer treatment is available only in select urban centers, research funding is minimal or sporadic, and awareness campaigns are rare or underfunded. Patients often face long wait times or financial barriers.
- 1. Poor infrastructure with severe barriers to treatment, little to no research funding, and lack of structured awareness campaigns. Cancer care is largely inaccessible, with many patients relying on out-of-pocket expenses or external aid.

Survival Rates, Early Detection and Palliative Care

## Strengths

- 5-year survival rate for gastric cancer in Australia is around 31%, higher than the global average due to better access to care.
- Robust palliative care networks supported by national policy guidelines.

## Opportunity

- Integration of AI and digital tools in primary care to prompt early referral based on GI symptoms.
- Expansion of nurseled symptom triage in rural and remote areas.

## Weakness

- Majority of GC cases are still diagnosed at advanced stages due to absence of routine screening.
- Indigenous populations face worse survival outcomes due to late presentation and access issues.

- Delayed diagnosis from overlapping symptoms with other gastrointestinal conditions.
- Aging population may increase incidence of advanced cases with comorbidities.

- 5. High survival rates, strong early detection programs, and well-established palliative care services. Patients have access to timely diagnosis, advanced treatments, and comprehensive end-of-life care.
  - 4. Good survival rates, effective early detection efforts, and accessible but regionally limited palliative care. Some disparities may exist in rural areas or for specific cancer types.
    - 3. Moderate survival rates, early detection available but not widespread, and palliative care services mainly in urban centers. Some patients experience delays in diagnosis or limited end-of-life care.
    - 2. Low survival rates, early detection efforts are inconsistent or underfunded, and palliative care is minimal or only available in select hospitals. Cancer patients face significant access barriers.
    - 1. Very low survival rates, poor early detection infrastructure, and almost no palliative care services. Many patients are diagnosed late and lack proper support for pain management and end-of-life care.

Utilization of Biomarkers

## Strengths

- HER2 and MSI testing are routinely performed in advanced GC cases in tertiary centres.
- PD-L1 CPS testing is increasingly available in research and select clinical practice settings

### Weakness

- Limited use of newer markers like CLDN18.2 and FGFR2b outside research trials.
- Regional pathology labs may lack capacity for NGS or IHC biomarker panels.

# Opportunity

- Government support for precision oncology through programs like the Genomic Cancer Medicine Program.
- Increased use of national cancer genomics networks to guide biomarker-driven treatment.

- High cost of comprehensive biomarker profiling may limit uptake in public settings.
- Disparities in testing turnaround time between metro and regional centres.

- Moderate utilization, often restricted to major hospitals or private healthcare settings. Some patients may not receive biomarker testing due to cost or limited availability in public healthcare systems.
  - Biomarker testing is available but underutilized, with significant barriers such as high costs, lack of awareness, or limited infrastructure. Many patients may not receive recommended biomarker assessments.
  - Biomarker testing is rarely performed, often due to lack of infrastructure, awareness, or financial barriers. Patients typically do not receive targeted therapies based on biomarker status.

0

**Clinical Guidelines** 

# Strengths

- National guidelines by Cancer Council Australia and eviQ provide standardized, evidence-based GC care protocols.
- Guidelines include biomarker testing (HER2, MSI) and outline immunotherapy use in refractory GC

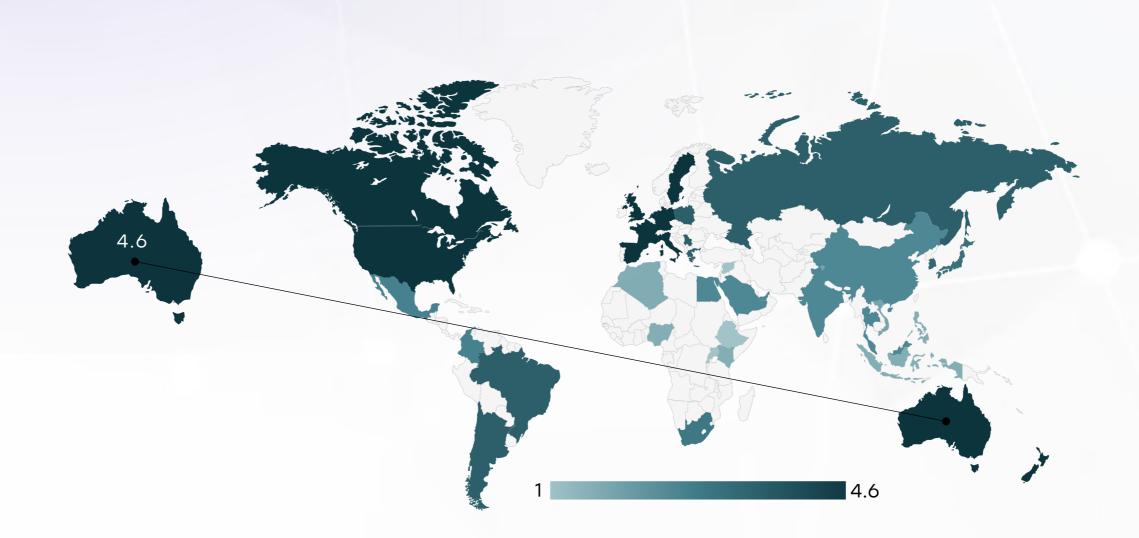

# Opportunity

- Incorporation of new therapies (e.g., zolbetuximab for CLDN18.2) into future guideline iterations.
- Culturally sensitive care models embedded into clinical protocols for immigrant populations.

## Weakness

- Guidelines not always updated rapidly with emerging biomarker-targeted treatments.
- Limited adaptability for multicultural populations with different GC risk profiles.

- Clinical inertia in lowvolume centres may limit implementation of evolving best practices.
- Disparities in clinician familiarity with novel biomarkers outside academic centres.

Reimbursement

## Strengths

- Universal coverage through Medicare includes surgery, chemotherapy, and some targeted therapies.
- HER2+ gastric cancer treatment (e.g., trastuzumab) is reimbursed under PBS for eligible patients.

# Opportunity

- Increased adoption of Managed Access Programs for high-cost drugs prior to PBS listing.
- Outcome-based reimbursement models for precision oncology.

## Weakness

- Delay in PBS listing for emerging drugs like immune checkpoint inhibitors and FGFR2b inhibitors.
- Out-of-pocket costs for advanced diagnostics or private consultations can be high.

- Pharmaceutical pricing pressures and budgetary limitations may restrict access to novel drugs.
- Variability in reimbursement timelines affects consistency across states.

- A structured reimbursement system exists, ensuring biomarker testing is covered through national healthcare systems, insurance, or publicprivate partnerships. Patients face no direct financial burden.
- A reimbursement framework is in place, but patients may still have out-of-pocket expenses such as co-pays, limited coverage, or financial caps on testing.
- No formal reimbursement system exists, meaning patients must fully cover the cost of biomarker testing out-of-pocket.

# Australia

Colorectal Cancer Screening

0

## Strengths

- Endoscopic services are widely available for symptomatic patients and those with a family history.
- H. pylori testing is integrated into GP and GI practice, especially for patients with dyspepsia.

# Opportunity

- Targeted screening in high-risk populations (e.g., Japanese, Korean, Chinese Australians).
- Primary care-led risk assessment tools incorporating lifestyle and infection data.

### Weakness

- No national screening program for GC despite rising incidence in certain subgroups (e.g., East Asian migrants).
- General practitioners may under-recognize early GC risk signs in younger or migrant patients.

- Over-reliance on symptom-based detection leads to latestage diagnosis.
- Population heterogeneity complicates standardized screening approaches.

Country	Gastric Cancer Screening
United States	Annual LDCT (50-80 years, high-risk smokers)
United Kingdom	LDCT for high-risk individuals (55-74 years)
Canada	LDCT for high-risk individuals (55-74 years)
Australia	No national program, high-risk groups advised LDCT
Germany	No national program, under evaluation
France	No national LDCT screening
Netherlands	Participating in European screening studies
Sweden	No national LDCT screening
Italy	Regional pilot LDCT screening
Spain	No national LDCT program
Poland	No national program
Japan	No national LDCT program
South Korea	LDCT for high-risk individuals (50-74 years)
China	No national LDCT program
India	No national LDCT program
Singapore	No national LDCT program
Saudi Arabia	No national LDCT program; some hospital-based opportunistic screening
UAE	No national LDCT program; early-stage pilot studies ongoing in select hospitals
Syria	No national LDCT program; screening not prioritized due to conflict
Malaysia	No program; high-risk CT pilots

Country	Gastric Cancer Screening
Thailand	No national LDCT program
South Africa	No national LDCT program
Kenya	No national LDCT program
Nigeria	No national LDCT program
Egypt	No national LDCT program
Morocco	No national LDCT program
Algeria	No national LDCT program
Ethiopia	No national LDCT program
Mexico	No national LDCT program
Brazil	No national LDCT program
Argentina	No national LDCT program
Chile	No national LDCT program
Colombia	No national LDCT program
New Zealand	No national LDCT program
Greece	No national LDCT program
Rwanda	No national LDCT program
Uganda	No national LDCT program
Serbia	No national LDCT program
Indonesia	No national LDCT program; opportunistic screening in private sector
Vietnam	No national LDCT program; early pilot screening studies in Hanoi and Ho Chi Minh
Philippines	No national LDCT program; feasibility and awareness programs under discussion
Russia	No formal national LDCT program; regional pilot screening programs in large cities
